

Task 1 — ADR Identification Basics

Case Scenario

Patient Details:

Name: Mr. Ramesh Kumar

Age: 52 years | Gender: Male

Weight: 68 kg

Medical History:

Hypertension (2 years)

Type 2 Diabetes (5 years)

Current Medications:

Enalapril 10mg (ACE Inhibitor) — started 3 weeks ago

Metformin 500mg — ongoing for 2 years

Presenting Complaint:

Patient reported persistent dry cough for the past 2 weeks. No fever, no respiratory infection, no prior history of cough or asthma.

ADR Identification Analysis

Step 1 — Symptom Review:

Persistent dry cough with no infection or respiratory cause identified.

Step 2 — Medication Timeline:

Cough started approximately 1 week after initiating Enalapril. Metformin has been used for 2 years with no such complaint previously.

Step 3 — Drug-Reaction Link:

Dry cough is a well-known ADR of ACE Inhibitors (Enalapril). Caused by accumulation of bradykinin in the respiratory tract.

Step 4 — Suspected Drug:

✓ Enalapril (ACE Inhibitor) — Suspected causative drug

Step 5 — Conclusion:

The dry cough is likely an Adverse Drug Reaction to Enalapril. Metformin is not associated with this symptom. Recommendation — consider switching to ARB (e.g., Losartan).
